External Examiner

Date: _____ **College Seal**

ACKNOWLEDGEMENT

We take this opportunity to express our gratitude to the department of BSc.IT for nurturing and teaching us the nuances required for developing this project. Our head of Department Mr. Dinesh Himatsinghani has been very helpful for making all facilities available to us. He always had a watchful eye on our progress throughout the project.

We are immensely thankful to our professor Mr. Manish Karale for his valuable and time inputs.

Once again we are grateful to our guide Mrs. Manisha Suthar without whom this project would be impossible. She was not only our guide but our source of inspiration. She was always available and patient with us in our times of need and we owe her our greatest appreciation.

We consider ourselves fortunate to have got an opportunity of working for Product Management System. Her vast details in the concerned field allowed us to incorporate the minute details of the subject in our project. She made us feel comfortable at all times with her kind words and encouragement. We would like to thank her dedicating some of his time from her schedule, to help us in our project with a stoical attitude.

Last but not the least our heartfelt gratitude to the Staff Members both at R.D. National College and Product Management System. for their corporation and support.

This project was a great learning and humbling experience and reflects our academic work at National College. We are sure that this experience will hold us good stead when we begin our professional careers.

Chapter 1

Introduction

- **Background**

  The purpose of this project is to provide and design a web-based application that allows the Accountant / Data Entriest to generate an purchase order (PO) with requirements like (items, quantity, services , agreed discount, types, etc.) on bases of equipments demanded by the particular firm

- **Objectives**

The college's product management system is to enhance and upgrade the existing system by increasing the efficiency and effectiveness. The software improves the working methods by replacing the existing manual system with the computer-based system. The system provides the uses a quick response with very accurate information.

- **Purpose and Scope**

  1.3.1 Purpose

  The purpose of this project is to provide and design a web-based application that allows the HOD / Accountant to streamline their purchase order entry tasks and manage their payment info in a more effective and efficient way. The system will ensure effective utilization service machine, generate and maintain Service records, and allow proper interaction and timely access to accurate information to those who require the information.

  1.3.2 Scope

  The proposed system seems to be better and efficient in terms of technology and integration point of view. The proposed paper shows the flow, structure and working of the product management system(PMS). PMS is user friendly i.e. easy to use. Thus, it is a time saving as well as cost efficient application.

- **Applicability**

  Applicability deals with the functionality of the proposed web application.

The product management system is to enhance and upgrade the existing system by increasing its efficiency and effectiveness. The software improves the working methods by replacing the existing manual system with the computer-based system. The system provides the uses a quick response with very accurate information.
In previous system we were facing manual inserting data with no data pulled from the database . This problem is solve by the providing better data getting droped down from the database by automatically filling and generating a purchase order (PO) number, total cost after SGST and CGST and agreed discounts in the product management system of the college.

- **Achievements**

  The system is designed to provide features of all purchase order and invoicing entries. Services provided by the service centres, locations of all the service centre in the vicinity etc. [2]. The above proposed model is easy to implement considering the available technology infrastructure. The models is simple, secure and scalable.The proposed model is based on serial communication. But for future scope in enlarging the system we can use connectionless system. We can even start online for registration and information based website..The initial model of the web application was not supported by the client and eventually development of new model had to be made catering the features listed and mentioned. With rigorous process such as managing and coordinating with client on daily basis and also unscheduled changes in the project, I learned to manage and document my work and also improve my PHP skills to develop the web application and made it more user friendly.

- **Organisation of Report**

  The project is developed for established college in the city named as **"R.D. & S.H. National college and S.W.A science college".** To manage all operations of the purchases made this project is being developed. The main objective of the Web page is to automate the existing system of manually maintained records of the Purchase Order and Invoicing made by the HOD / Accountant to maintain the monetary positions and other related transactions made by the department. Providing domain specific user authenticated on the web page. This application can be used by any other college or firm to automate the process of manually maintaining the records related to the subject of maintaining the stock and liquid flows. The main purpose of the web application is to provide a way to the user to store the data digitally and giving access to the data based on their roles in the The web application will be user friendly meaning easily operable by anyone. It will also keep the record of the departments. The records of the stocks or and other equipments required that will be kept securely and user authentication is required to view a specific type of data.

Chapter 2

Survey of Technologies

- **PHP**

  PHP: (recursive acronym for PHP: Hypertext Preprocessor) is a widely-used open source general-purpose scripting language that is especially suited for web development and can be embedded into HTML. Hypertext Preprocessor (or simply **PHP**) is a server-side scripting language designed for Web development, but also used as a general-purpose programming language. PHP originally stood for *Personal Home Page*, but it now stands for the recursive acronym *PHP: Hypertext Preprocessor*. PHP is free software released under the PHP License, which stipulates that:

  The best things in using PHP are that it is extremely simple for a newcomer, but offers many advanced features for a professional programmer. Don't be afraid reading the long list of PHP's features. You can jump in, in a short time, and start writing simple scripts in a few hours.Although PHP's development is focused on server-side scripting, you can do much more with it.

  The client would receive the results of running that script, but would not know what the underlying code was. You can even configure your web server to process all your HTML files with PHP, and then there's really no way that users can tell what you have up your sleeve.

What is a PHP File?

- PHP files can contain text, HTML, CSS, JavaScript, and PHP code
- PHP code are executed on the server, and the result is returned to the browser as plain HTML
- PHP files have extension ".php"

What Can PHP Do?

- PHP can generate dynamic page content
- PHP can create, open, read, write, delete, and close files on the server
- PHP can collect form data
- PHP can send and receive cookies
- PHP can add, delete, modify data in your database
- PHP can be used to control user-access
- PHP can encrypt data

Why PHP?

- PHP runs on various platforms (Windows, Linux, Unix, Mac OS X, etc.)
- PHP is compatible with almost all servers used today (Apache, IIS, etc.)
- PHP supports a wide range of databases
- PHP is free. Download it from the official PHP resource: www.php.net
- PHP is easy to learn and runs efficiently on the server side

- **MY SQL**

MySQL is the most popular Open Source Relational SQL Database Management System. MySQL is one of the best RDBMS being used for developing various web-based software applications. MySQL is developed, marketed and supported by MySQL AB, which is a Swedish company.

What is a Database?

A database is a separate application that stores a collection of data. Each database has one or more distinct APIs for creating, accessing, managing, searching and replicating the data it holds.

Other kinds of data stores can also be used, such as files on the file system or large hash tables in memory but data fetching and writing would not be so fast and easy with those types of systems.

Nowadays, we use relational database management systems (RDBMS) to store and manage huge volume of data. This is called relational database because all the data is stored into different tables and relations are established using primary keys or other keys known as **Foreign Keys**.

A **Relational Database Management System (RDBMS)** is a software that –

- Enables you to implement a database with tables, columns and indexes.

- Guarantees the Referential Integrity between rows of various tables.
- Updates the indexes automatically.
- Interprets an SQL query and combines information from various tables.

MySQL Database

MySQL is a fast, easy-to-use RDBMS being used for many small and big businesses. MySQL is developed, marketed and supported by MySQL AB, which is a Swedish company. MySQL is becoming so popular because of many good reasons –

- MySQL is released under an open-source license. So you have nothing to pay to use it.
- MySQL is a very powerful program in its own right. It handles a large subset of the functionality of the most expensive and powerful database packages.
- MySQL uses a standard form of the well-known SQL data language.
- MySQL works on many operating systems and with many languages including PHP, PERL, C, C++, JAVA, etc.
- MySQL works very quickly and works well even with large data sets.
- MySQL is very friendly to PHP, the most appreciated language for web development.
- MySQL supports large databases, up to 50 million rows or more in a table. The default file size limit for a table is 4GB, but you can increase this (if your operating system can handle it) to a theoretical limit of 8 million terabytes (TB).
- MySQL is customizable. The open-source GPL license allows programmers to modify the MySQL software to fit their own specific environments.

Advantages Of Using MySQL

- **It's Easy To Use**
  MySQL is very easy to install, and thanks to a bevy of third-party tools that can be added to the database, setting up an implementation is a relatively simple task. In addition, it's also an easy database to work with. So long as you understand the language, you shouldn't run into too many problems.

- **Support Is Readily Available Whenever Necessary**

Although Oracle's history of supporting its customers can be spotty at best, the nature of MySQL – which got its start as an open-source platform – means that there's a large and thriving community of developers and enthusiasts to which one can turn for help. This is due in large part to the popularity of the solution, the end result of which is no shortage of experts.

- **It's Open-Source**
  Oracle's purchase of Sun Microsystems (and by association, MySQL) was met with some contention from the development community. The general fear was that Oracle would transform the tool into a closed, proprietary ecosystem. Thankfully, though Oracle has tightened its grip on MySQL somewhat, it can still be considered an open-source database option, as the code is still available for free online.

- **It's Incredibly Inexpensive**
  Depending on what you plan to use it for, a MySQL implementation could range in price from free to $10,000 or more. Either way, it's significantly less expensive than most other database options on the market (save for MySQL's open-source competitors).

- **It's An Industry Standard (And Still Extremely Popular)**
  Although MySQL's popularity has waned somewhat in recent years, it remains one of the most-used database systems in the world. It's compatible with virtually every operating system, and is more or less an industry standard. This is, of course, in spite of all the folks who say it's on the way out.

Chapter 3

Requirements and Analysis

- **System Requirements**

  Software Specification:

  Software : XAMPP
  Operating System : Windows 7 or Higher
  Browser/Interpreter : Google Chrome, etc with Flash Compatibility

  Front End : HTML5, CSS3, Javascript, Bootstrap framework.
  Back End : MySQL
  Connectivity : Internet
  Server : Apache

  Hardware Specification:

  Processor : Intel Core Duo 2.0 GHz or higher
  RAM : Minimum 1GB or higher
  Hard Disk : 20GB or higher

3.2 Requirement Specification

The web application will have 4 types of users

- HOD / Data Entriest
- Accountant

These users will have different authentication and different web panel to use according to their role in the service center.

- Provides the searching factors based on various factors, such as purchase order made, pending amount to be paid, view all purchase order(PO). which in the existing system was a difficult task.
- Editing, adding and updating of Records is improved which results in proper resource management of college data.

- All users which were allowed to use it can have access to their data and modify/read them in real time simultaneously.
- A stable Internet connection is needed to access those data via web browser which the store is well equipped with.

Chapter 4

System Design

4.1 Basic Modules

The Basic Module of this project is to create all Purchase Order (PO) entries and store the data in the database and generate a purchase order with its requirements and sent it to its supplier when printed. All these processes are done in a web-based application.

4.2 Data Design

4.2.1 Schema Design

Chapter 5
FEASIBILITY STUDY:

Feasibility study is conducted once the problem is clearly understood. Feasibility study is a high level capsule version of the entire system analysis and design process. The objective is to determine quickly at a minimum expense how to solve a problem. The purpose of feasibility is not to solve the problem but to determine if the problem is worth solving.

The system has been tested for feasibility in the following points.

1. Technical Feasibility
2. Economical Feasibility
3. Operational Feasibility.

1. Technical Feasibility

The project entitles "Courier Service System" is technically feasibility because of the below mentioned feature. The project was developed in Java which Graphical User Interface.

It provides the high level of reliability, availability and compatibility. All these make Java an appropriate language for this project. Thus the existing software Java is a powerful language.

2. Economic Feasibility

The computerized system will help in automate the selection leading the profits and details of the organization. With this software, the machine and manpower utilization are expected to go up by 80-90% approximately. The costs incurred of not creating the system are set to be great, because precious time can be wanted by manually.

3. Operational Feasibility

In this project, the management will know the details of each project where he may be presented and the data will be maintained as decentralized and if any inquires for that particular contract can be known as per their requirements and necessaries.

Implementation:

Implementation is the stage where the theoretical design is turned into a working system. The most crucial stage in achieving a new successful system and in giving confidence on the new system for the users that it will work efficiently and effectively.

The system can be implemented only after thorough testing is done and if it is found to work according to the specification.

It involves careful planning, investigation of the current system and its constraints on implementation, design of methods to achieve the change over and an evaluation of change over methods a part from planning. Two major tasks of preparing the implementation are education and training of the users and testing of the system.

The more complex the system being implemented, the more involved will be the systems analysis and design effort required just for implementation.

The implementation phase comprises of several activities. The required hardware and software acquisition is carried out. The system may require some software to be developed. For this, programs are written and tested. The user then changes over to his new fully tested system and the old system is discontinued.

Index.php

```
 <?php
session_start();
include('connect.php');

if(isset($_POST['submit'])) {
  $user_name=$_POST['uname'];
  $password=$_POST['pword'];
  $query=mysqli_query($conn,"select * from user where username='$user_name'and
password='$password'") or die("unable to connect".mysqli_error());
  $row=mysqli_fetch_array($query);
  if ($row['username']==$user_name && $row['password']==$password) {
    if ($row['user_type']=="accountant") {
      $_SESSION['username']=$user_name;
      header('location:account-dashboard.php');
    } else {
  $_SESSION['username']=$user_name;
  header('location:dashboard.php');
    }
  } else {
  $open_dashboard="wromg username or password";
  echo $open_dashboard;
  }
 }

Chapter 6

TESTING:

Testing is a process of executing a program with the intent of finding an error. Testing is a crucial element of software quality assurance and presents ultimate review of specification, design and coding.

System Testing is an important phase. Testing represents an interesting anomaly for the software. Thus a series of testing are performed for the proposed system before the system is ready for user acceptance testing.

A good test case is one that has a high probability of finding an as undiscovered error. A successful test is one that uncovers an as undiscovered error.

Testing Objectives:

1. Testing is a process of executing a program with the intent of finding an error
2. A good test case is one that has a probability of finding an as yet undiscovered error
3. A successful test is one that uncovers an undiscovered error

Testing Principles:

- All tests should be traceable to end user requirements
- Tests should be planned long before testing begins
- Testing should begin on a small scale and progress towards testing in large
- Exhaustive testing is not possible
- To be most effective testing should be conducted by a independent third party

The primary objective for test case design is to derive a set of tests that has the highest livelihood for uncovering defects in software. To accomplish this objective two different categories of test case design techniques are used. They are

- White box testing.
- Black box testing.

White-box testing:

White box testing focus on the program control structure. Test cases are derived to ensure that all statements in the program have been executed at least once during testing and that all logical conditions have been executed.

Block-box testing:

Black box testing is designed to validate functional requirements without regard to the internal workings of a program. Black box testing mainly focuses on the

information domain of the software, deriving test cases by partitioning input and output in a manner that provides through test coverage. Incorrect and missing functions, interface errors, errors in data structures, error in functional logic are the errors falling in this category.

Testing strategies:

A strategy for software testing must accommodate low-level tests that are necessary to verify that all small source code segment has been correctly implemented as well as high-level tests that validate major system functions against customer requirements.

Testing fundamentals:

Testing is a process of executing program with the intent of finding error. A good test case is one that has high probability of finding an undiscovered error. If testing is conducted successfully it uncovers the errors in the software. Testing cannot show the absence of defects, it can only show that software defects present.

Testing Information flow:

Information flow for testing flows the pattern. Two class of input provided to test the process. The software configuration includes a software requirements specification, a design specification and source code.

Test configuration includes test plan and test cases and test tools. Tests are conducted and all the results are evaluated. That is test results are compared with expected results. When erroneous data are uncovered, an error is implied and debugging commences.

Unit testing:

Unit testing is essential for the verification of the code produced during the coding phase and hence the goal is to test the internal logic of the modules. Using the detailed design description as a guide, important paths are tested to uncover errors with in the boundary of the modules. These tests were carried out during the programming stage itself. All units of ViennaSQL were successfully tested.

Integration testing :

Integration testing focuses on unit tested modules and build the program structure that is dictated by the design phase.

System testing:

System testing tests the integration of each module in the system. It also tests to find discrepancies between the system and it’s original objective, current specification and system documentation. The primary concern is the compatibility

of individual modules. Entire system is working properly or not will be tested here, and specified path ODBC connection will correct or not, and giving output or not are tested here these verifications and validations are done by giving input values to the system and by comparing with expected output. Top-down testing implementing here.

Acceptance Testing:

This testing is done to verify the readiness of the system for the implementation. Acceptance testing begins when the system is complete. Its purpose is to provide the end user with the confidence that the system is ready for use. It involves planning and execution of functional tests, performance tests and stress tests in order to demonstrate that the implemented system satisfies its requirements.

Tools to special importance during acceptance testing include:

Test coverage Analyzer – records the control paths followed for each test case.

Timing Analyzer – also called a profiler, reports the time spent in various regions of the code are areas to concentrate on to improve system performance.

Coding standards – static analyzers and standard checkers are used to inspect code for deviations from standards and guidelines.

Test Cases:

Test cases are derived to ensure that all statements in the program have been executed at least once during testing and that all logical conditions have been executed.

Using White-Box testing methods, the software engineer can drive test cases that

- Guarantee that logical decisions on their true and false sides.
- Exercise all logical decisions on their true and false sides.
- Execute all loops at their boundaries and within their operational bounds.
- Exercise internal data structure to assure their validity.

The test case specification for system testing has to be submitted for review before system testing commences.

CONCLUSION:

The package was designed in such a way that future modifications can be done easily. The following conclusions can be deduced from the development of the project.

- Automation of the entire system improves the efficiency
- It provides a friendly graphical user interface which proves to be better when compared to the existing system.
- It gives appropriate access to the authorized users depending on their permissions.
- It effectively overcomes the delay in communications.
- Updating of information becomes so easier.
- System security, data security and reliability are the striking features.
- The System has adequate scope for modification in future if it is necessary.
